

**ABSTRACT OF THE DISCLOSURE**

Methods, systems, and programs for recalibrating a sense amplifier are disclosed. A representative method includes: measuring a physical property of a memory cell to produce a first measurement; comparing the first measurement to a first range, the first range being indicative of a short or open circuit in the memory cell; halting the sense of the selected memory cell if the first measurement exceeds the first range; comparing the first measurement to a second range, the second range being a predetermined range signifying a recalibration of the sense amplifier may be necessary; proceeding with the sense if the first measurement is within the first range and the second range; repeating the steps of measuring and comparing for a predetermined number of iterations, if after each iteration, the measurement exceeds the second range but is within the first range; and recalibrating the sense amplifier, if after the predetermined number of iterations, the measurement still exceeds the second range but is within the first range.
